KICKSTREAM · SYNTHETIC MATCH INSIGHTS ENGINE

AI stream agents for live football.

Seven analyst agents read the match. The studio puts it on air.

7 AGENTS | 3 TEAMS | 20 LANGUAGES | AZURE

github.com/Yash-Kavaiya/kickstream · 20 October 2026

The match explains itself, on every platform at once.

A synthetic match in. Live insight, commentary and a broadcast out.

The problem a studio has today

PRODUCER

"We have the event feed. Turning it into graphics, odds and a line worth saying, live, takes a room of analysts."

OPERATOR

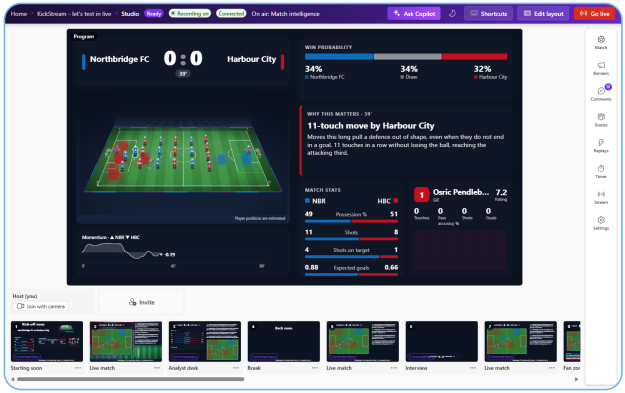

"And I want the channel on overnight, in more than one language, without anyone in the chair."

Data without a story
Events arrive faster than a person can explain them.

Licensed data is costly
Building on a synthetic match removes that barrier.

Many platforms
YouTube, X, Facebook and Twitch each want the same show.

This is the program the host sends

Synthetic, 39'
Northbridge FC v Harbour City. Fictional clubs.

Agents on screen
Win odds, momentum, xG, 3D pitch, player card.

Why it matters
Written by the Explainability Agent.

SECTION 1

The agents

01

Seven agents, three analyst teams

Match Reading

Event Interpreter, Tactical Analyst, Player Tracking. Every play, the tactics, each player.

Forecast

Prediction, Explainability. Who wins, what comes next, and why it matters.

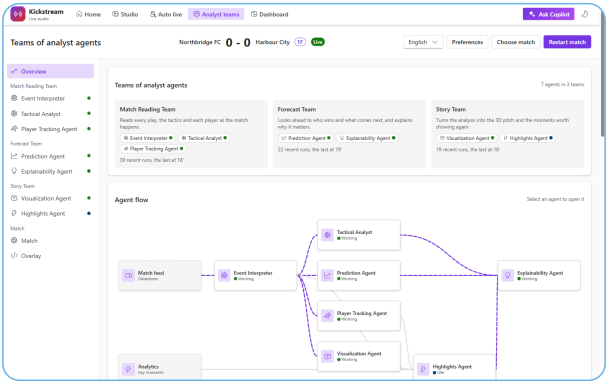

Story

Visualization, Highlights. The 3D pitch and the moments worth showing again.

The agents compute. Only one writes, so every number on air is traceable.

Analyst teams, live

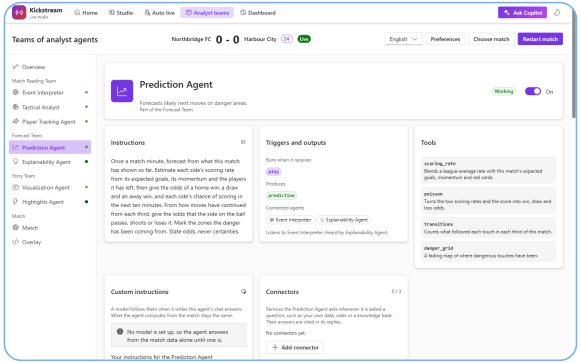

/match: three team cards with their recent runs, and the agent flow from the match feed.

What each agent produces

Team	Agent	Output
Reading	Event Interpreter	Third, flank, phase, danger
Reading	Tactical Analyst	Pressure, tempo, patterns, control or chaos
Reading	Player Tracking	Rating, heat map, distance, top speed
Forecast	Prediction	Win, draw, loss, next ten minutes, danger grid
Forecast	Explainability	English “why this matters”, at most 20 a match
Story	Visualization	3D pitch from the ball and the player on it
Story	Highlights	Ranked moments and hidden events

Every agent is yours to shape

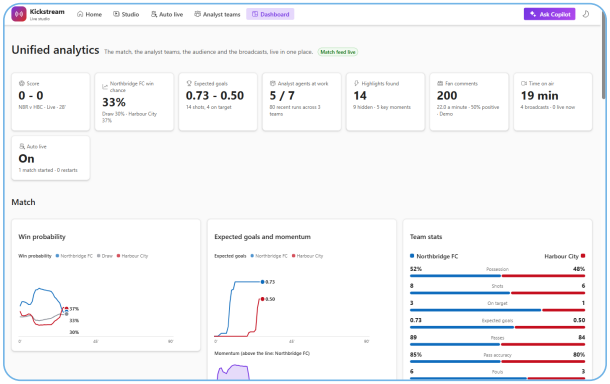

Custom instructions
Up to 2,000 characters. The model follows them after its own rules.

Three connectors
Your odds, data or knowledge base. Cited as sources, treated as facts.

Chat
Ask the agent about its part of the match.

One page for the whole show

/dashboard: the match, the teams' work, players, audience, broadcasts and auto live, live. Studio users only.

SECTION 2

The broadcast

02

Four jobs, one broadcast

Go live

Home, broadcast, studio. One Go live control.

Show the match

Score, pitch, banners, goal celebration and narration.

Bring guests

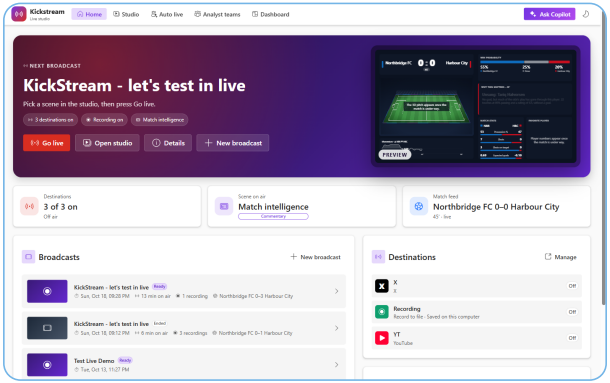

Speaker, co-host, member. Four seats on stage.

Cut reels

Up to four 15-second vertical clips, finished in Clipchamp.

Nine templates, nine background plates, one commentary for the program.

Home is the operator’s desk

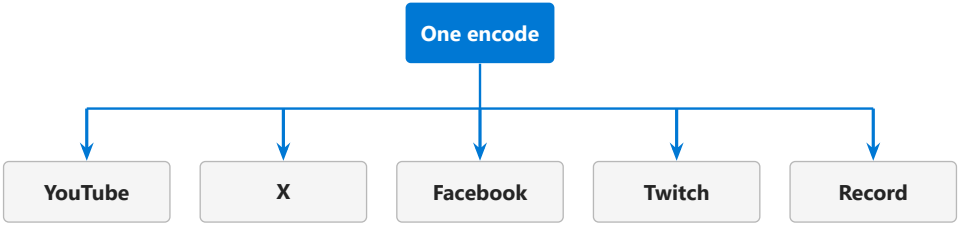

Next broadcast, live program preview, scene on air, match feed and destinations.

Create, compose, go live, then cut

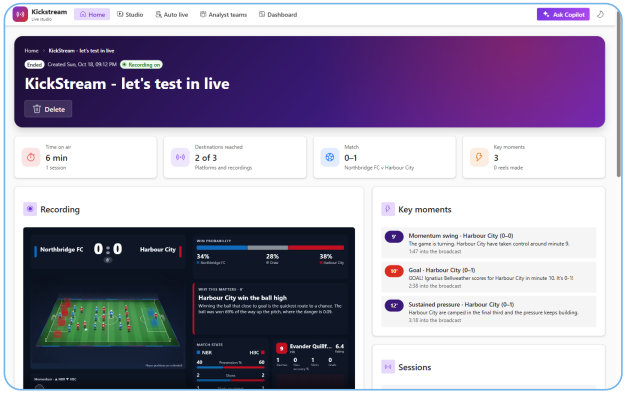

Takeaway Record to file needs no stream key. YouTube, Facebook and Twitch need a key. X also needs that account's server address.

One encode, five places

ffmpeg copies that one picture. A failed destination does not stop the others.

The finished broadcast keeps its story

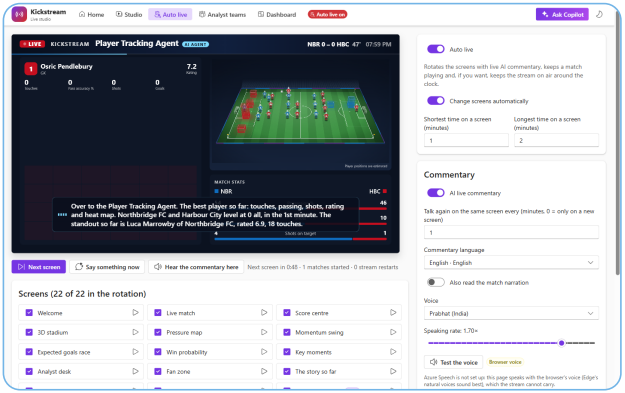

Stats
Time on air, reach, score.

Key moments
With their commentary.

Recordings
The source of reels.

Auto live runs the channel by itself

22 screens, one per agent among them. An AI commentator introduces each one.

Twenty languages, from English and Hindi to Arabic, Japanese and Tamil, each with Azure neural voices.

Stream 24/7 restarts the stream if it drops.

Templates carry the show when the model is absent

WORDS

WITH A MODEL
Microsoft Foundry with Entra ID, or an OpenAI-compatible endpoint. Written once per mode and language.

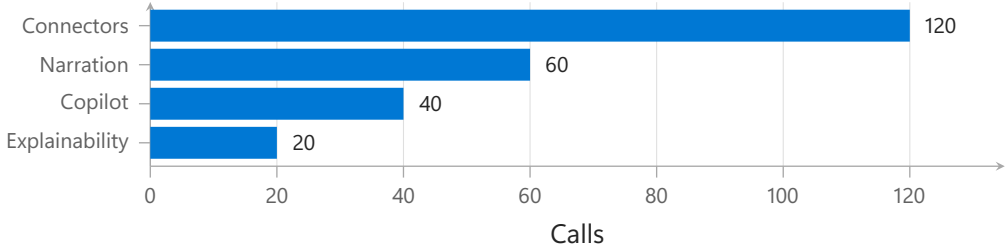

WITHOUT ONE
Scripted narration. The item is marked scripted.

MATCH

DEPLOY DEFAULT
The synthetic match. Fictional clubs. Same seed, same game.

OPTIONAL FEEDS
StatsBomb, API-Football, OpenLigaDB. Off unless real_sources.

Calls the product allows in one match

Caps from the product, not a measured audience. Model cost does not grow with viewers: each line is written once per variant.

SECTION 3

Running it

03

Push to main, and Azure follows

Takeaway GitHub Actions signs in with OIDC, no secret. Terraform state sits in a private storage account. Deploy waits until the new revision answers.

The deploy is one replica in Central India

1
replica. Memory is not shared.

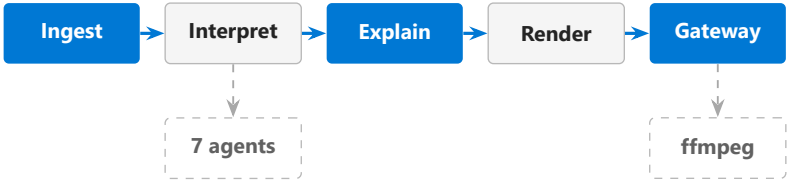

2
vCPU. ffmpeg and the hidden browser.

4Gi
memory. 2 GiB for each vCPU.

90d
Cosmos match-log TTL.

Region default centralindia. Container Apps, Cosmos DB, Azure Files, Communication Services, AI Speech, Entra ID. Probes call /api/health.

One process, five stages, one encode

Memory holds the match, the studio and the encode. Files sit on Azure Files. The match log sits in Cosmos DB match_log, so a restart keeps every replay.

Entra guards the studio. Guests stay on the invite

AzureADMyOrg
The deployer and studio_users. Header x-ms-client-principal-id.

Public view is read-only
/live and /match without a sign-in. Studio pages and the dashboard redirect.

Keys stay off the page
Stream and connector keys are never returned. Cosmos local keys are disabled.

Facts, not instructions
Connector answers reach the model as facts. Only studio users change agents.

Limits to say out loud

Limit	What it means for this repository
StatsBomb	StatsBomb Open Data is non-commercial and must not ship in a paid offer.
Marketplace	Kickstream does not implement Microsoft Marketplace SaaS fulfillment, an Entra purchase landing page, or a live Partner Center offer.
One box	A second replica would not see this match, this studio, or this ffmpeg process.
Speech	Only Azure speech is on the captured stream. The browser voice is silence on air.
Shortcuts	Scenes switch with a click. Keyboard shortcuts are not implemented.

Seven agents read the match. The studio puts it on air.
